

HW7

- Use slides to show weathers
- First slide is always local weather
- Each slide shows both city weather and 7-day forecast (5 day is okay)
- “Add” appends a new weather slide
- Each slide has “remove weather” button at the bottom, which removes this slide
- Local weather slide cannot be removed (no button)

Hint

- in home.ts
 - Keep a list of forecast (which is also a list)
 - Maintain the same index as weatherList
- in home.html
 - You need nested *ngFor loops
 - outer loop for cities
 - inner loop for forecast of each city
 - Find forecast of current city (hint: use indexOf)

Demo

- App ID
 - AE6D13EA

Deadline

- 10/19 (Wed) 2pm
